HOW DOES FNIRS WORK?

~650–950 nm

**Absorption spectra
(natural logarithm
base) for different
chromophores present
in human tissue.**

~800 nm

HOW DOES FNIRS WORK?

BEER-LAMBERT LAW

Transmittance, $T = I/I_0$

Absorbance, $A = -\log(I/I_0)$

Beer-Lambert Law:

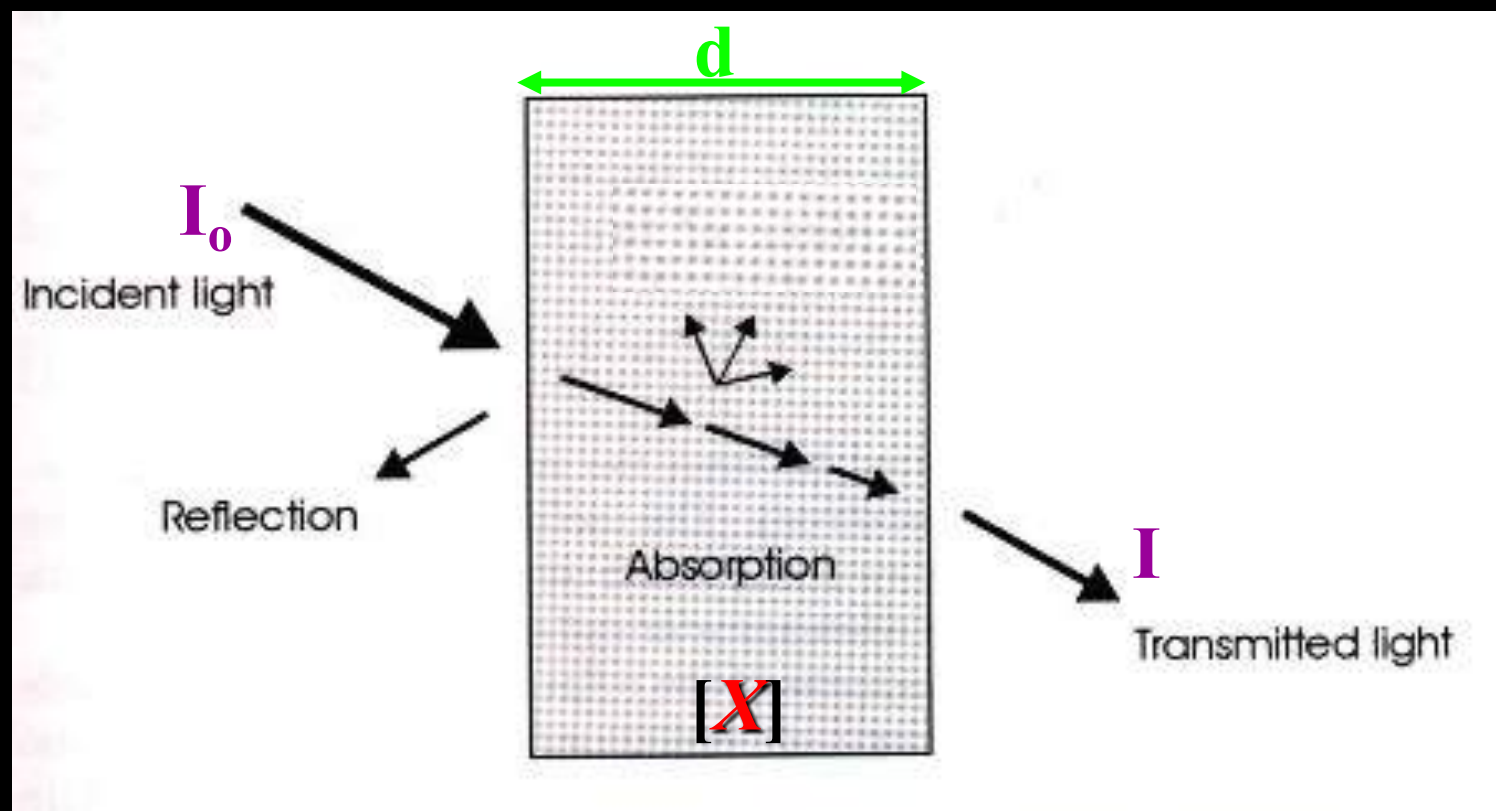

$$A = \epsilon [X] d$$

where:

d = distance between I_0 and I

ϵ = absorptivity ($M^{-1} \text{ cm}^{-1}$)

$[X]$ = concentration of absorber (M)

MODIFIED BEER-LAMBERT LAW (MBLL)

Transmittance, $T = I/I_0$

Absorbance, $A = -\log(I/I_0)$

Modified Beer-Lambert Law:

$$A = \varepsilon [X] d \times DPF + G$$

where:

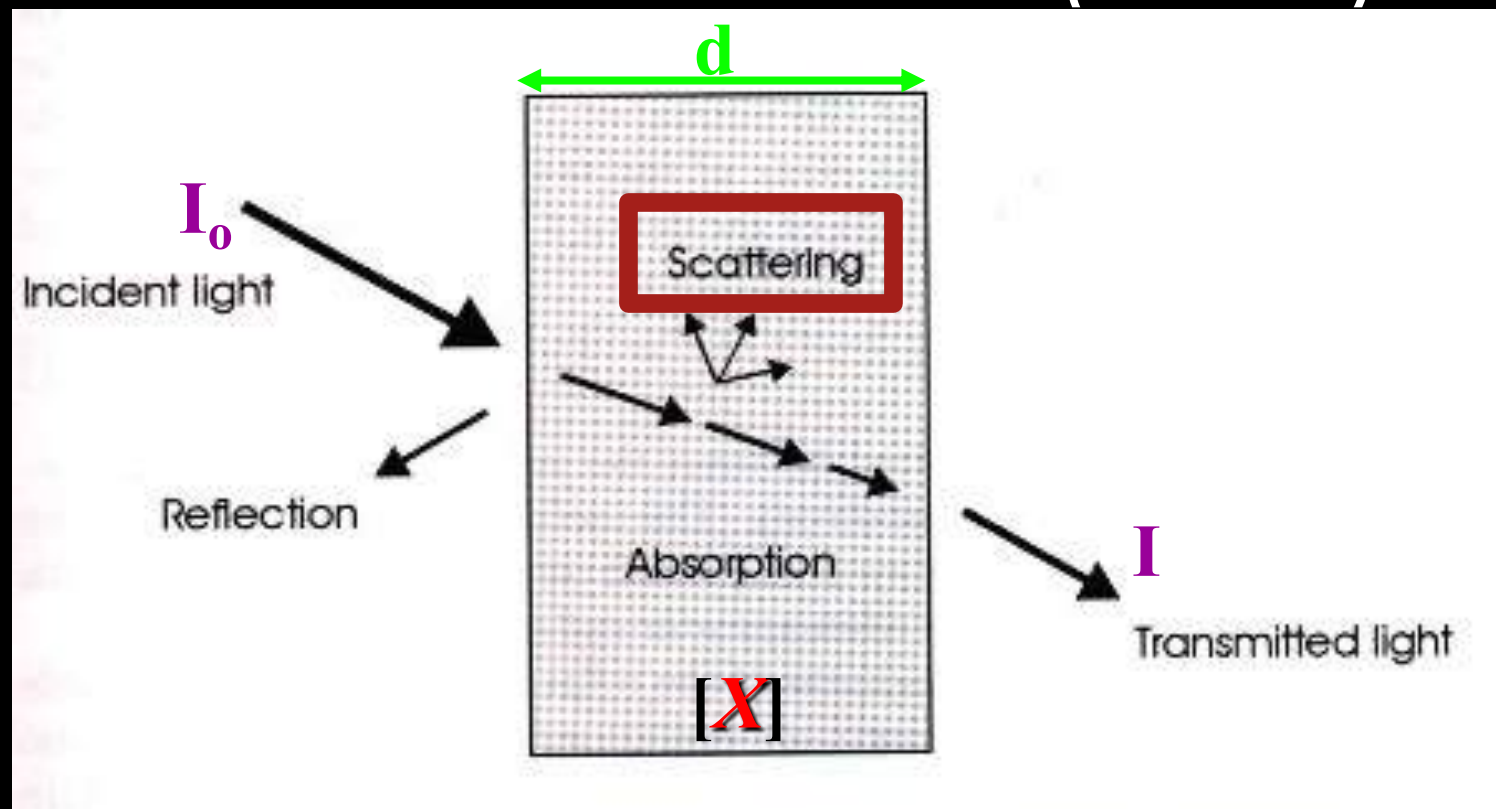

d = distance between I_0 and I

ε = absorptivity ($M^{-1} \text{ cm}^{-1}$)

$[X]$ = concentration of absorber (M)

DPF = differential pathlength factor

G = Scattering loss factor (generally unknown)

DIFFERENTIAL SPECTROSCOPY

Absolute attenuation measurement

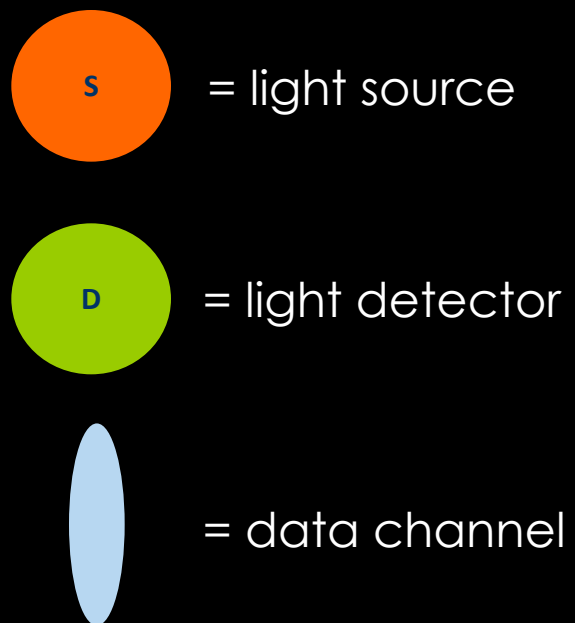

$$A = -\log_{10} \left(\frac{I_{IN}}{I_{OUT}} \right)$$

Differential spectroscopy

$$\Delta A = \varepsilon(\lambda) \cdot \Delta c \cdot d \cdot DPF(\lambda)$$

TOPOGRAPHY

'Nearest-neighbor'
measurements are done with
spacing of 2-3 cm between
sources and detectors.

PENETRATION

Source: Fig 1. from Pinti, P., Tachtsidis, I., Hamilton, A., Hirsch, J., Aichelburg, C., Gilbert, S., & Burgess, P. W. (2020). The present and future use of functional near-infrared spectroscopy (fNIRS) for cognitive neuroscience. *Annals of the New York Academy of Sciences*, 1464(1), 5-29.

TRUE OR FALSE QUESTION

- FNIRS measure the ~~absolute~~ concentration of oxygenated hemoglobin in the blood flow.

TRUE OR FALSE QUESTION

- The penetration distance is 15 mm for source-detector distance of 30 mm.

ADVANTAGES: FMRI VS. FNIRS

ADVANTAGES: EEG VS. FNIRS

SUMMARY OF ADVANTAGES: FNIRS

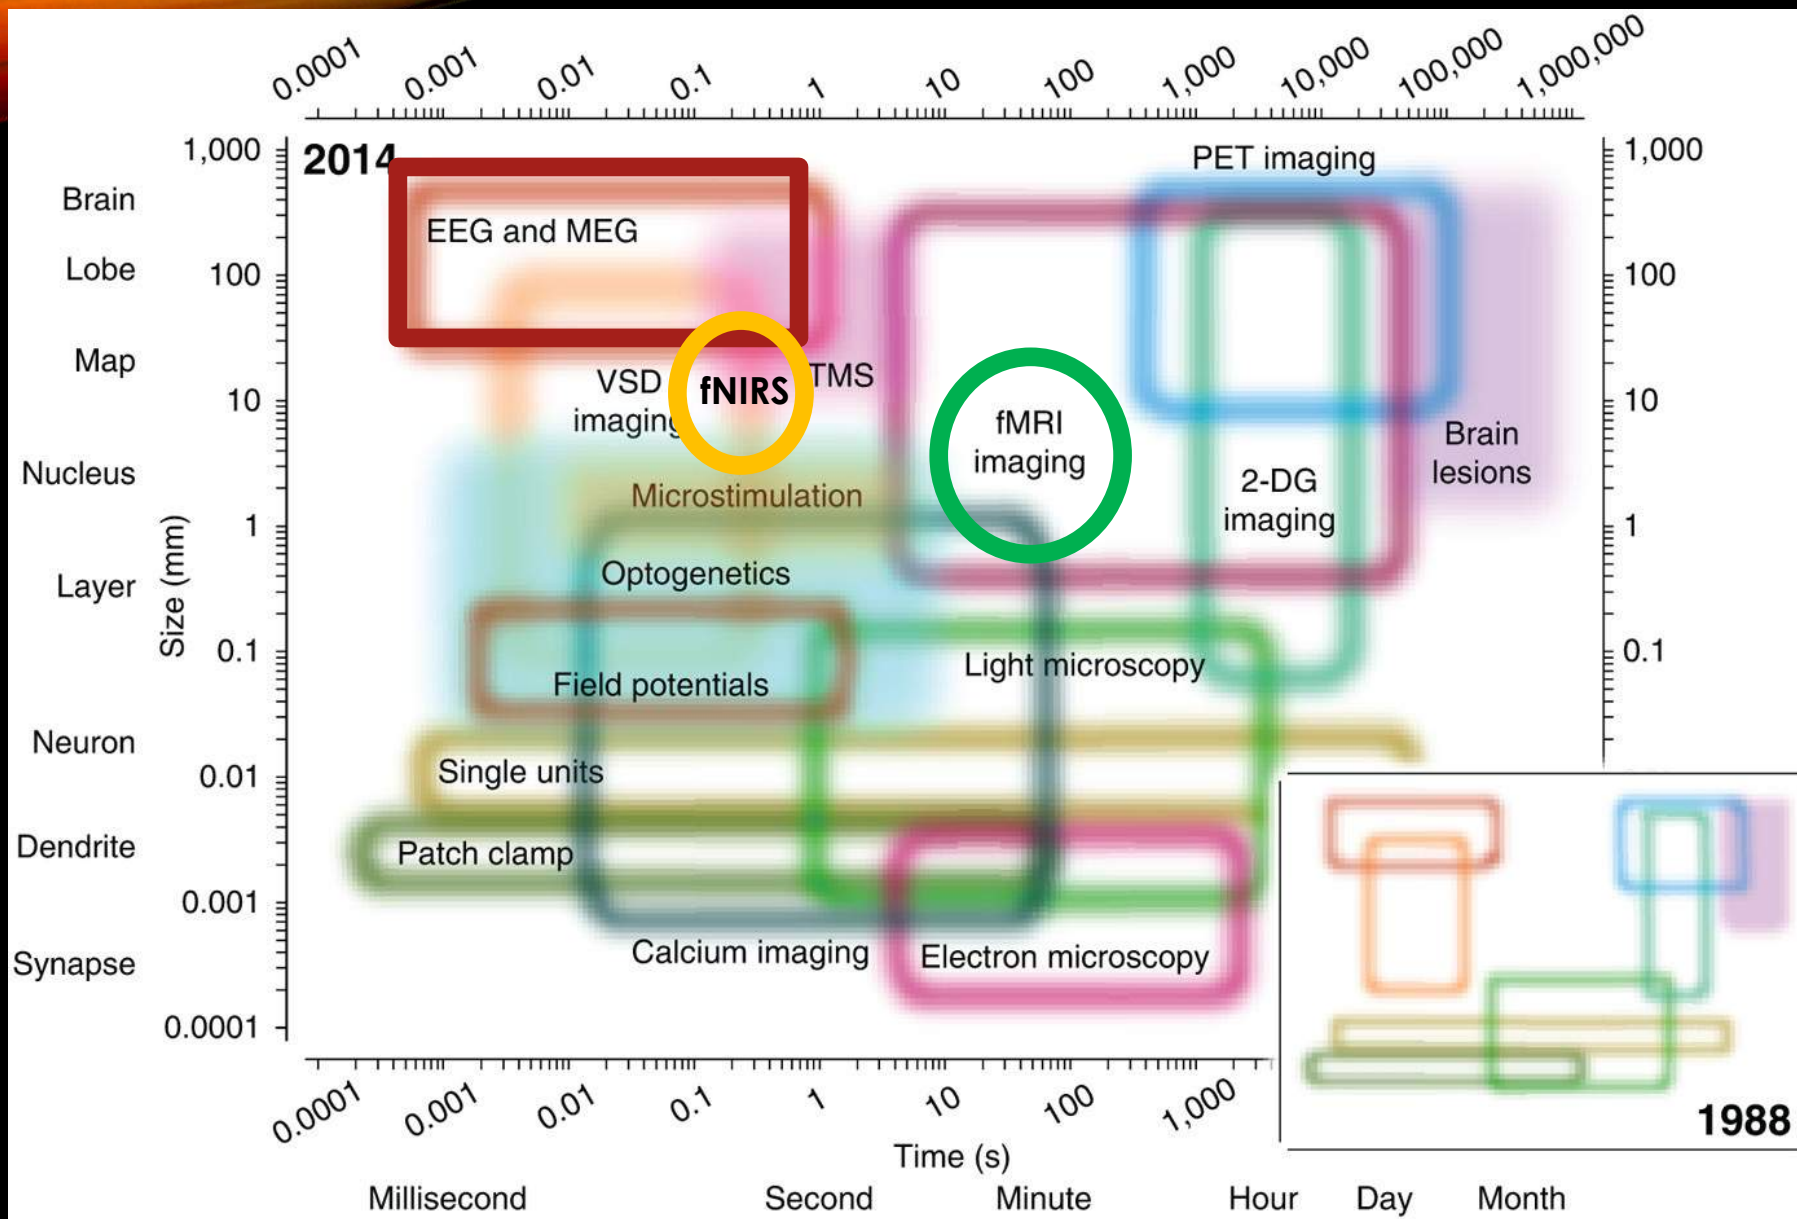

- Compact, low-cost sensing hardware
- Noninvasive, continuous measures
- Highly configurable and scalable platforms
- Information-rich sensing data
 - BOLD-like response *without* the magnet
 - Source localization >> EEG
 - Minimal sensitivity to movement artifacts

LIMITATIONS OF FNIRS

- Cannot measure hemodynamic responses involving “deep” brain regions (e.g., basal ganglia, amygdala).
- Relatively lower spatial resolution (1-1.5 cm): Precise identification of brain areas is improved, but not perfected, with 3D MRI.

NEUROIMAGING METHODS COMPARISONS

Adapted from Sejnowski, 2014

NIRSCOUTX SYSTEM @ UNL

- 16 sources and 20 detectors
- Can be configured up to 64 sources and 32 detectors
- 8-bit trigger input and output
- LED sources

	Laser	LED
Measurement depth	+	-
Portability	-	+
Price	-	+
Wavelength	+	-
Safety	+	+

TRUE OR FALSE QUESTIONS

- fNIRS has higher temporal resolution than fMRI. 
- EEG has higher spatial resolution than fNIRS and fMRI. 
- If you are interested in neuronal response in amygdala, you can use fNIRS. 
- Both fNIRS and fMRI are based on the mechanisms of neurovascular coupling. 
- LED-based fNIRS system can measure deeper response than Laser-based fNIRS system. 

OUTLINES

- What is fNIRS?
- What can we do with fNIRS?
- How shall we start fNIRS research?

Fig. 1. Number of fNIRS publications per year.

Boas 2014

fNIRS research is rapidly growing; the number of publications has doubled every 3.5 years over the past 20 years, passing 200 per year in 2012 (Fig. 1).

This growth reflects the increasing number of scientists and clinicians beginning to utilize fNIRS for a broad range of applications.

APPLICATIONS OF FNIRS

Neurology	Psychiatry	Psychology & Education	General Research
Alzheimer's	Anxiety Disorders	Attention	BCI
Dementia	Behavioral Disorders	Body Representation	Multi-Modal Fusion
Depression	Childhood Disorders	Comprehension	Neuroeconomics
Epilepsy	Eating Disorders	Developmental Disorders	Neuroergonomics
Intra-operative monitoring	Personality Disorders	Emotion	Pain
Parkinson's	Substance Abuse	Language/Linguistics	Sleep
Rehabilitation	Schizophrenia	Learning	Sports Sciences
Stroke recovery		Memory	

Subjects: Infants & Adults

Standard NIRScaps can be worn for several hours with minimal discomfort. Long-term monitoring caps are available upon request, with specialized components to increase comfort and reduce

flat probes is ideal for subjects with sensitive skin or heads.

NIRx NIRScaps are comfortable and conforming. Most end-users find it more comfortable than EEG, as it does not involve the use of any scalp abrasion, or

HYPERSCANNING = MULTI-SUBJECT MEASUREMENTS

Multi-subject concurrent measurements have become increasingly popular lately.

Peer group, parent-child, and other relationships are effectively quantifiable with the use of our hyperscanning setups.

NIRS/EEG – Concurrent Measurements

NIRx's integrated EEG/NIRS solutions are numerous. Here we see integration with the NIRScoutX system and an active electrode EEG setup.

Synchronization of NIRS & EEG

Brain-Computer Interface with NIRS Streaming

BCI PERFORMANCE IMPROVEMENT: EEG + HBO

Portable fNIRS laboratories

The NIRSport is lightweight and compact. It is easily setup in any environment, allowing researchers to meet subjects anywhere!

Wearable NIRS Study while biking

(Piper et al. Neuroimage 2013): The study exhibited the viability of the portable solution. The subject rode a bicycle while wearing a 16-probe NIRS system.

WIGGINS 2016 -- RELIABILITY

Research Paper

Speech-evoked activation in adult temporal cortex measured using functional near-infrared spectroscopy (fNIRS): Are the measurements reliable?

Ian M. Wiggins^{a, b, c, *}, Carly A. Anderson^{a, b}, Pádraig T. Kitterick^{a, b},
Douglas E.H. Hartley^{a, b, c, d}

^c Medical Research Council (MRC) Institute of Hearing Research, University of Nottingham, University Park, Nottingham, NG7 2RD, United Kingdom

^d Nottingham University Hospitals NHS Trust, Derby Road, Nottingham, NG7 2UH, United Kingdom

WIGGINS 2016 -- RELIABILITY

- The reliability of auditory-evoked activation measured using fNIRS is largely unknown.
- Investigated the test-retest reliability of speech-evoked fNIRS responses in normally-hearing adults.
- Seventeen participants underwent fNIRS imaging in two sessions separated by three months.

fNIRS Optodes' Location Decider

10-10 10-5 (EEG_32) 10-5 (EEG_64) Summary

- Graphical user interface of the fNIRS Optodes' Location Decider (fOLD).
- Depicted is the blank 10–10 layout as displayed upon toolbox initialization.
- [Zimeo Morais et al, 2018 Neurophotonics](#)

COREGISTRATION

1. Anatomical scans of each subject available. Accurate positions of optodes in 3D space on the head prior to measurement available.
2. No anatomical scans available. Accurate positions of optodes in 3D space available for each participant.
3. No anatomical scans available. Positions of optodes relative to standard 10/20 EEG landmarks available.
4. No anatomical scans available. ~~Optodes have~~ arbitrary positions over the scalp, no reference to standard landmarks.

ACCURATE REGISTRATION ON INDIVIDUAL SUBJECT ANATOMY

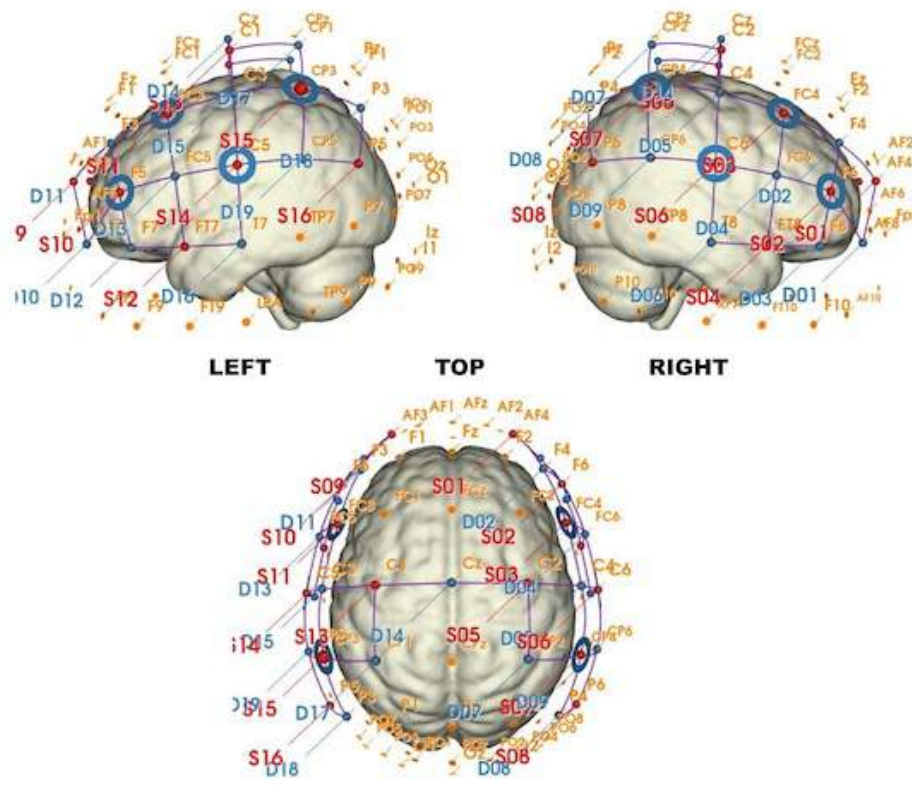

NO ANATOMICAL SCANS AVAILABLE.
ACCURATE POSITIONS OF OPTODES IN 3D SPACE
AVAILABLE FOR EACH PARTICIPANT

- In this case, there is no need for normalization of individual anatomies. Digitized positions of optodes are projected onto a standard template.
- Cortical structures of interest are then identified as previously.

NO ANATOMICAL SCANS AVAILABLE. POSITIONS OF OPTODES RELATIVE TO STANDARD 10/20 EEG LANDMARKS AVAILABLE

MONTAGE DESIGN

- The Trade Off:
 - Number of channels: Children vs Adult
 - How much time do you have
 - What is your subject's tolerance
- Channel Spacing
 - Infant Children: 1.5-3 cm
 - Adults: 2.5-5 cm
 - Regions of interest: Channel Averaging
 - Subjects Head Size
 - Including these distances in your analysis

Montage
Design

- Design your montage.

Study
Design

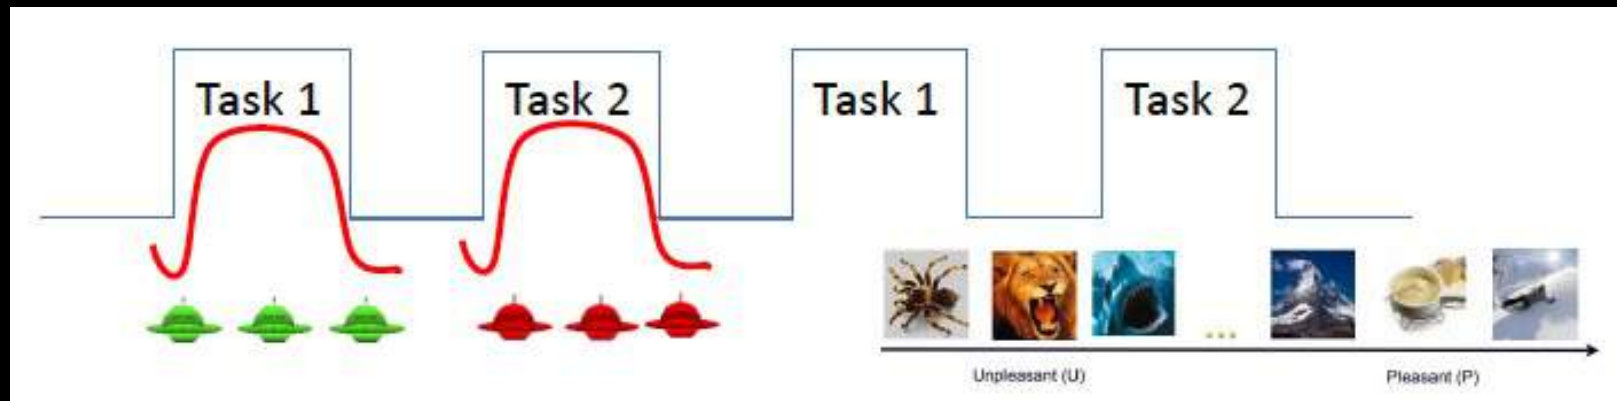

- Design your task (s).

Test Runs

- Measure what you are intended to measure.

EXPERIMENTAL DESIGN

- What type of task design should be implemented?
- Simple Block Design
 - Improving Signal to Noise Ratio (SNR)
 - Like fMRI studies / Repeatable
 - Grouping similar tasks or event
- Not so flexible to the complexity

EXPERIMENTAL DESIGN

- Event Related
 - Characterizing the shape of the hemodynamic response
 - You need more trials
 - Timing cost
 - Great if you want to reduce the effect of habituation and expectation
 - Good for behavioral studies, and combining with EEG

EXPERIMENTAL DESIGN

- Mixed Block Design
 - Efficient in detecting the differences in Hemodynamic response amplitude
 - You are generally interested in the size of Hemodynamic response
 - More trials in less time than event related design
 - spacing trials apart to get an estimate for each individual event

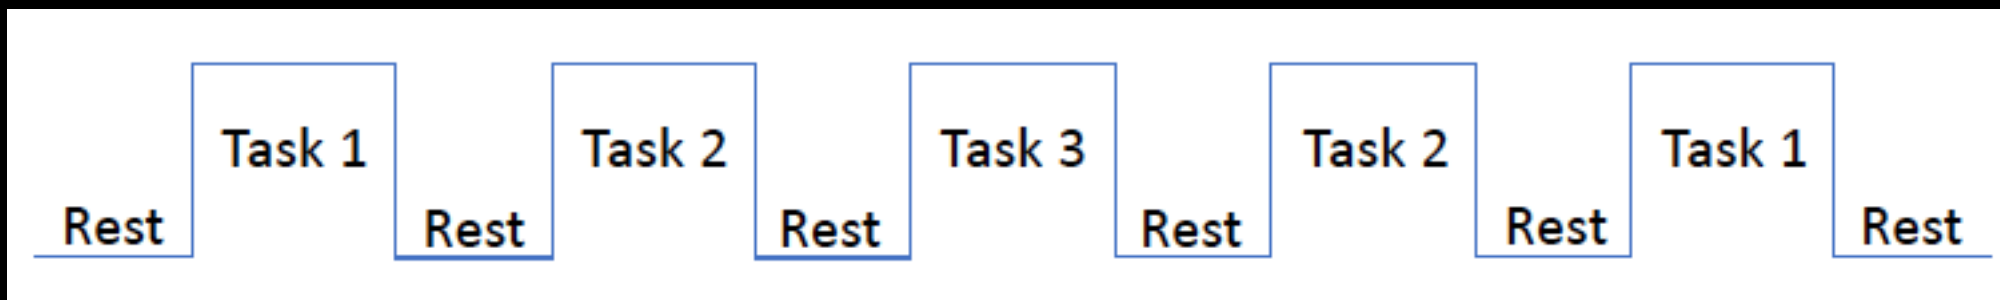

EXPERIMENTAL DESIGN

- Be aware of task length
 - Min ~10 15 seconds per block to capture the hemodynamic response
 - Resting blocks in between to allow the decline
- Randomizing the blocks
- More repetition is better
 - Efficiency of the design can increase with number of blocks
- Collect imaging data for each task in one session
 - Unless you need to compare the data before and after therapy etc.
 - Ensure that your task conditions and environment stay the same.

EXPERIMENTAL DESIGN

- How many rest periods do you need?
 - As much as your task condition.
 - You can sometimes use this rest period to see if you task is working.
 - Better efficiency when the rest timing is equal to average stimulation time of the task related conditions.

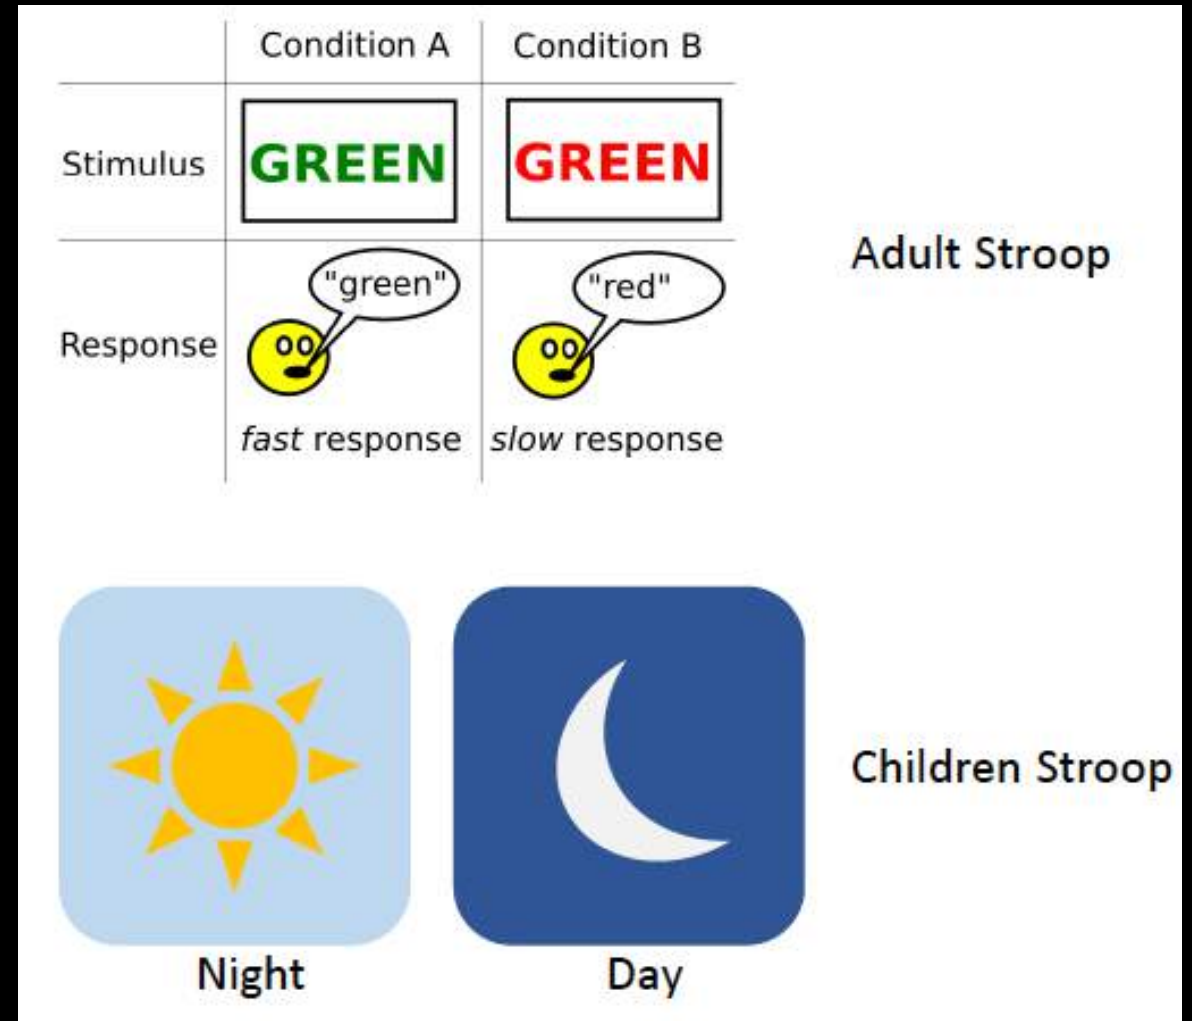

EXPERIMENTAL DESIGN

- Be mindful of your subject population
 - Age correlates with attention span
 - Behavioral phenotypes correlates with both attention and task difficulty
 - Cognitive flexibility can be an issue
 - Changing the task to accommodate the subject population
 - Controlling for subject age, IQ etc. in your analysis

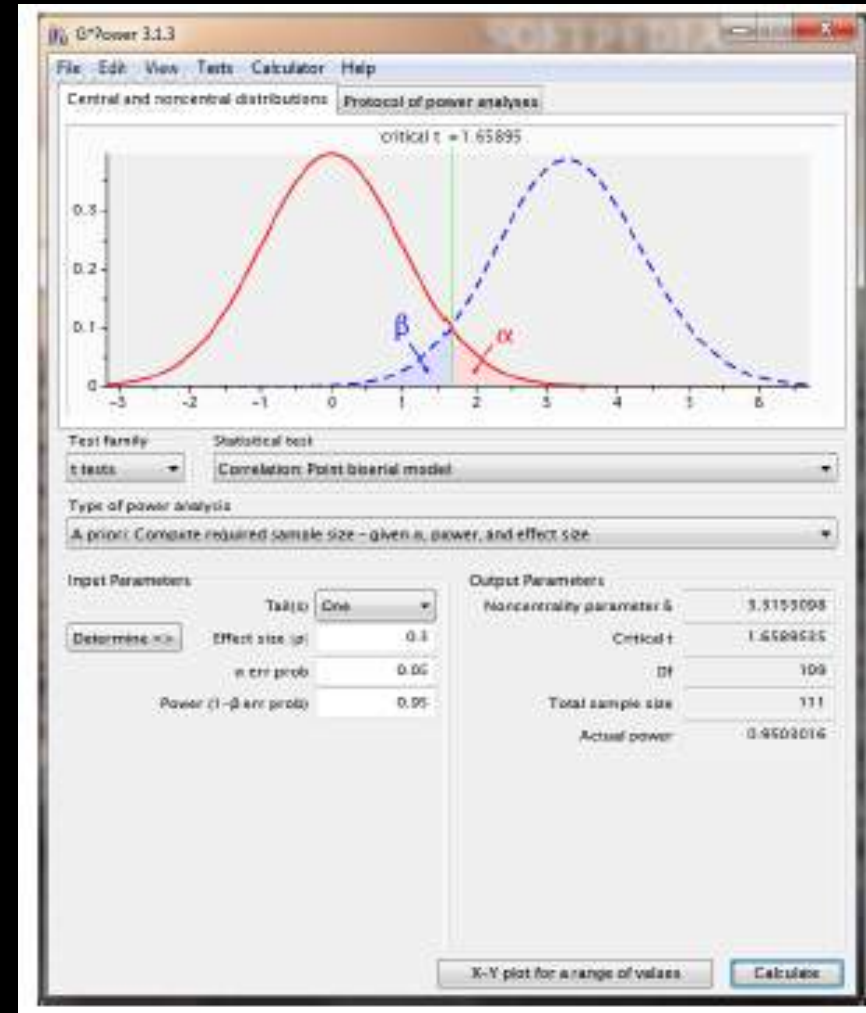

EXPERIMENTAL DESIGN

- Task modification
 - Based on age range
 - Based on neurocognitive profile
 - The type of task depends on your research question, neurocognitive profile and behavioral phenotype

EXPERIMENTAL DESIGN

- Sample Size: Increase the efficiency
 - Study power depends more heavily on number of subjects
- Variability within subject
 - Hair vs no hair
 - Age --> extracerebral tissue
 - Gender --> extracerebral tissue
 - Think about DPF

Montage
Design

- Design your montage.

Study
Design

- Design your task (s).

Test Runs

- **Measure what you are intended to measure.**

PILOT DATA COLLECTION

Collect

Collect at least pilot data from two participants.

Analyze

Analyze your pilot data.

Check

Check if your experimental design measures what you expect to measure.

IF YOU WANT TO LEARN MORE
NEUROIMAGING TECHNIQUES, YOU
CAN TAKE SLPA 856.

Offered every Fall semester.

COURSE RECOMMENDATION

- **SLPA 856: Neuroimaging & Language Development** – offered every fall semester.
