

Measuring Program Quality Using Sensors

Childcare Staff's Experiences, Perceptions,
Needs

Presented by: Danae Dinkel (UNO), Erica Ryherd (UNL),
Dawn Davis (UNL) & Abbie Raikes (UNMC)

Funding provided by an NSF Smart & Connected
Communities Pilot Grant

Literature Review Components

Potential Impacts

How does IEQ impact occupants?

Guidelines

What IEQ recommendations exist?

Sensors

How have sensors been used?
What were the findings?

**Indoor
Environmental
Quality (IEQ)**

Early Childcare
(birth to school age)

**71+
guidelines &
publications**

SENSORY environment

Wide range of potential impacts, such as:

- mood
- comfort
- health

- learning
- physical activity
- language development

Some of these impacts we understand from other domains

Literature Review Findings

- performance
- concentration
- mood
- comfort
- health

A photograph of a woman with dark hair, smiling and holding a large white rectangular sign. She is in a classroom setting with colorful geometric shapes (a red triangle and a green square) visible in the background.

SOUND environment

Example Childcare Findings

26%
Children with noise doses higher than 85 dB

McLaren & Dickenson 2005

Childcare teachers had more voice disorders
(e.g., nodules, laryngitis)

Compared to hospital nurses

Söderssten et al. 2002

THERMAL environment & INDOOR AIR QUALITY

CO₂ concentrations in childcare centers related to asthma & wheezing in children

Carreiro-Martins et al. 2014

Example Childcare Findings

**Air conditioning
design linked to:**

**rhinitis, phlegm,
cough,
respiratory
health**

Zuraimi et al. 2006

**Lower air
exchange rates
linked to
more sick days**

Kolarik et al. 2016

LIGHTING environment

Example K-12 Findings

Higher color temperature lighting positively impacts teacher perceptions of:

- alertness
- attitude
- energy level

Morrow 2018

**Dynamic lighting
helps support
different activities
throughout the
day**

Mogas-Recalde & Palau 2020

**Daylight design
impacts**

student performance

Baloch et al. 2021

Exploring Early Childhood Educators' Perceptions of Sensor Use

Purpose

Assess early childhood education and care (ECEC) professionals' willingness to accept and utilize sensor-based technology to measure different aspects of early childhood education and care quality

Explored use of the following sensors:

- 1) Indoor built environment (noise, thermal, light)
- 2) Children's behavior (language, physical activity)
- 3) Multi-use (video cameras)

Mixed Methods Study

Total

ECEC Professionals
Received Survey Link

Survey

40 questions via Qualtrics

Interview

Semi-structured interviews

150 Received

**76 responded
to survey**

**10
interviews**

What are ECEC professionals' current experiences with sensors?

Survey Findings

Least used

Physical activity and noise sensors
(2%)

Use and perceptions of video camera use

- 2 participants used continuous video monitoring, 1 as teaching tool
- Concerns of privacy and security

Desire for new assessments

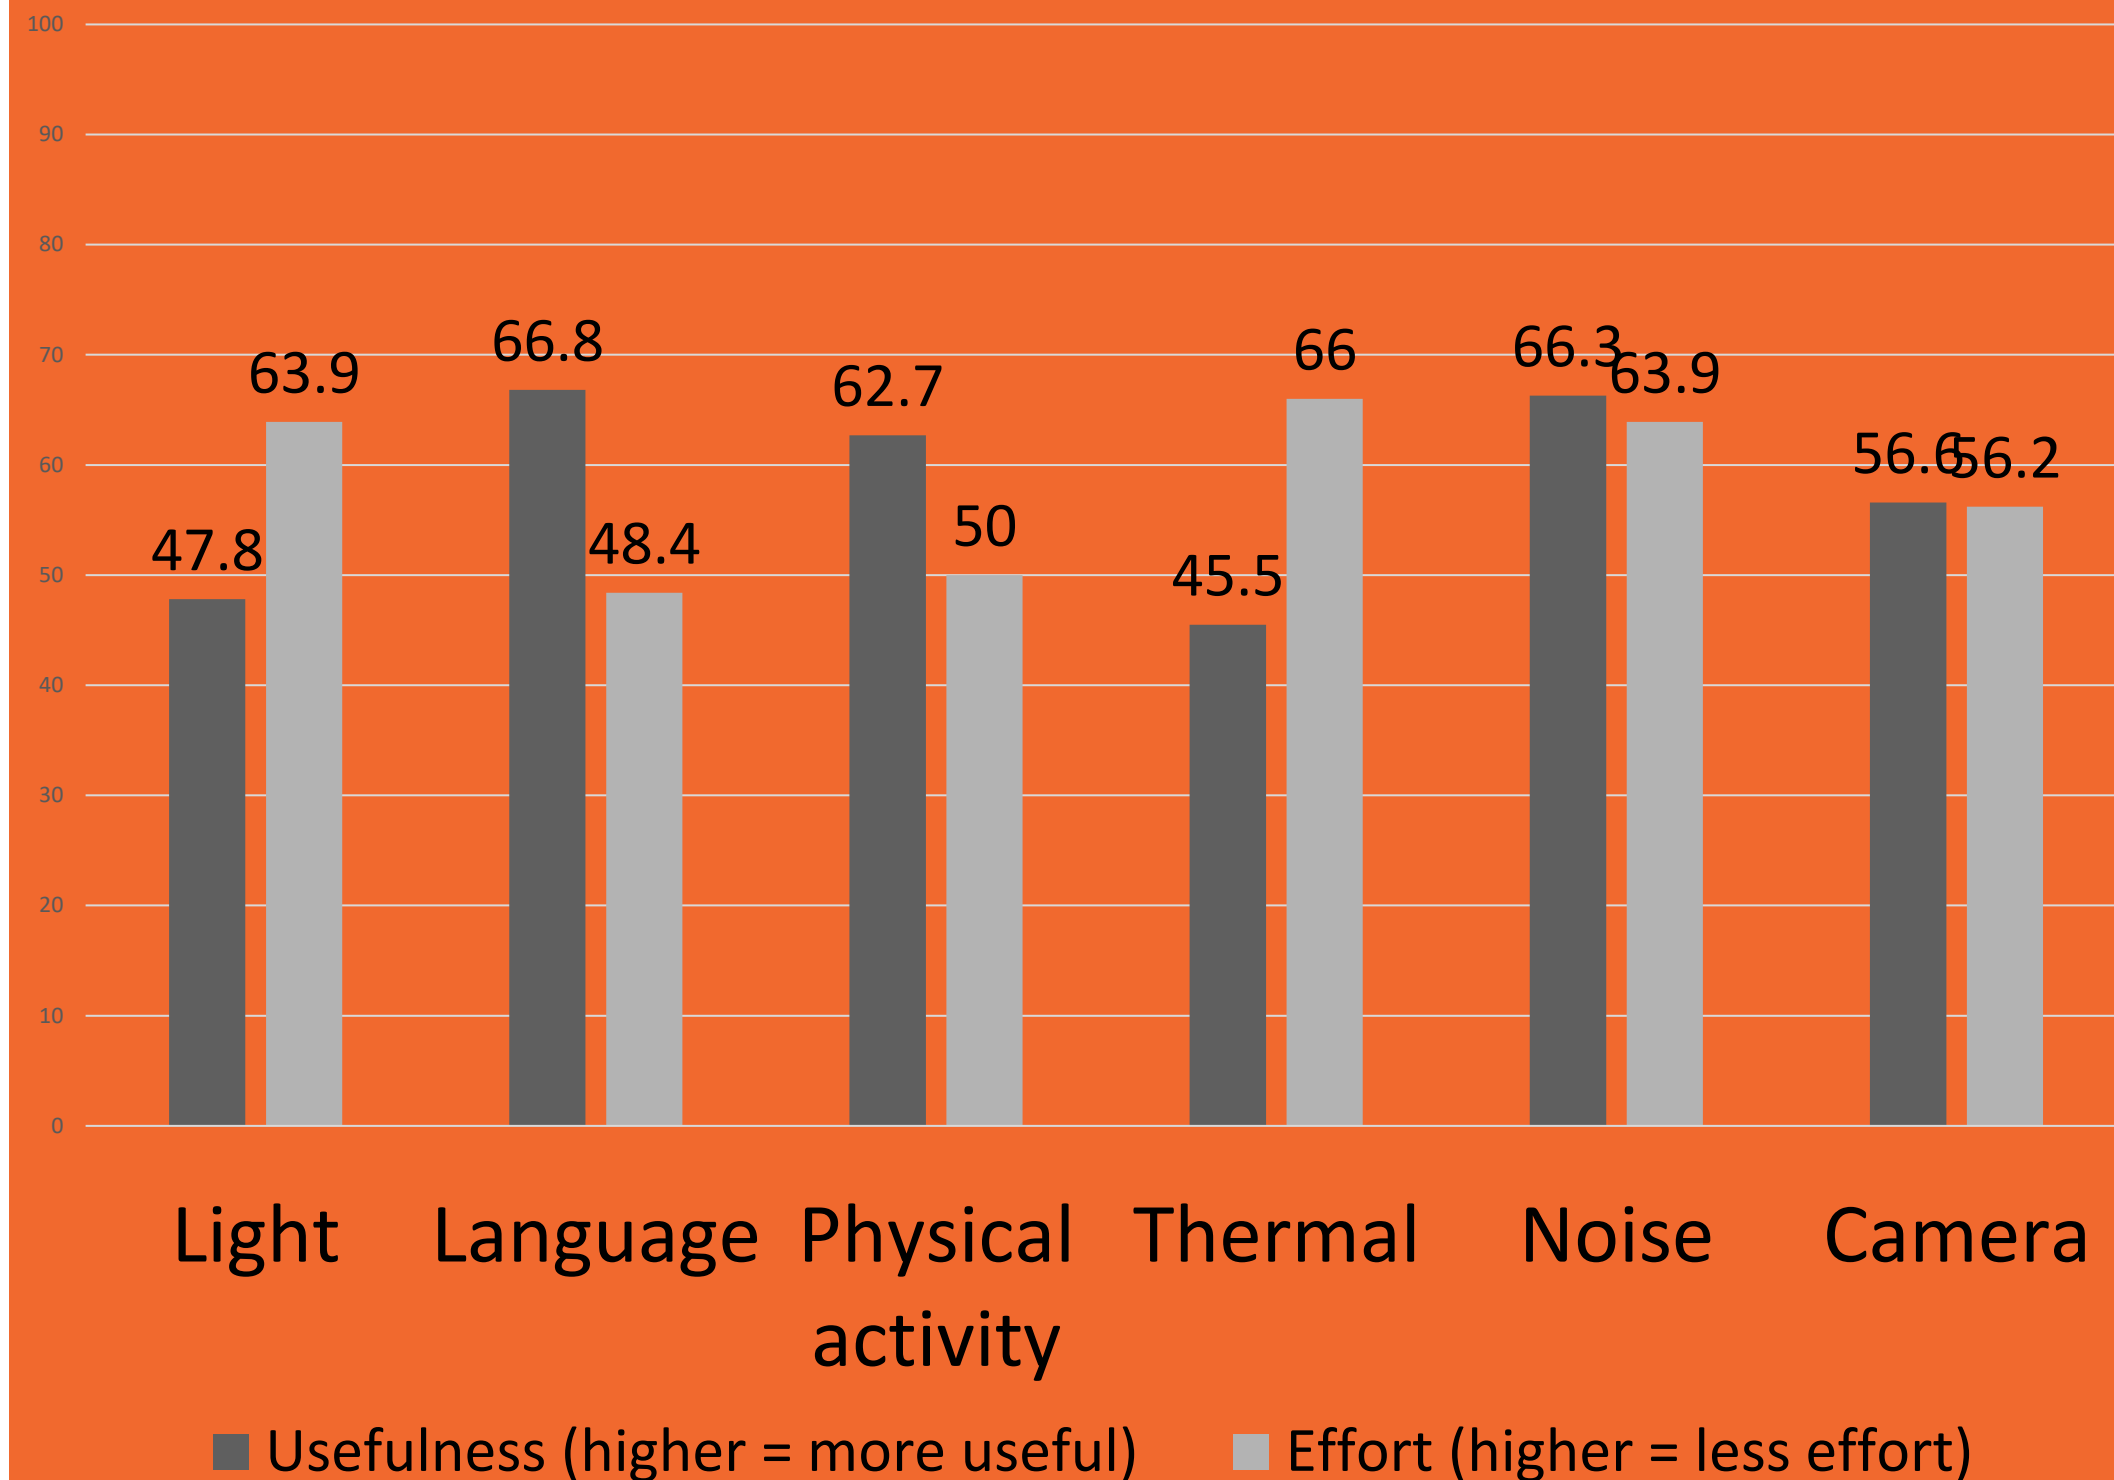

- Wide range from child outcomes to interactions and social-emotional learning

Interview Findings

What are ECEC professionals' perceptions of the use of sensors to measure aspects of quality within programs?

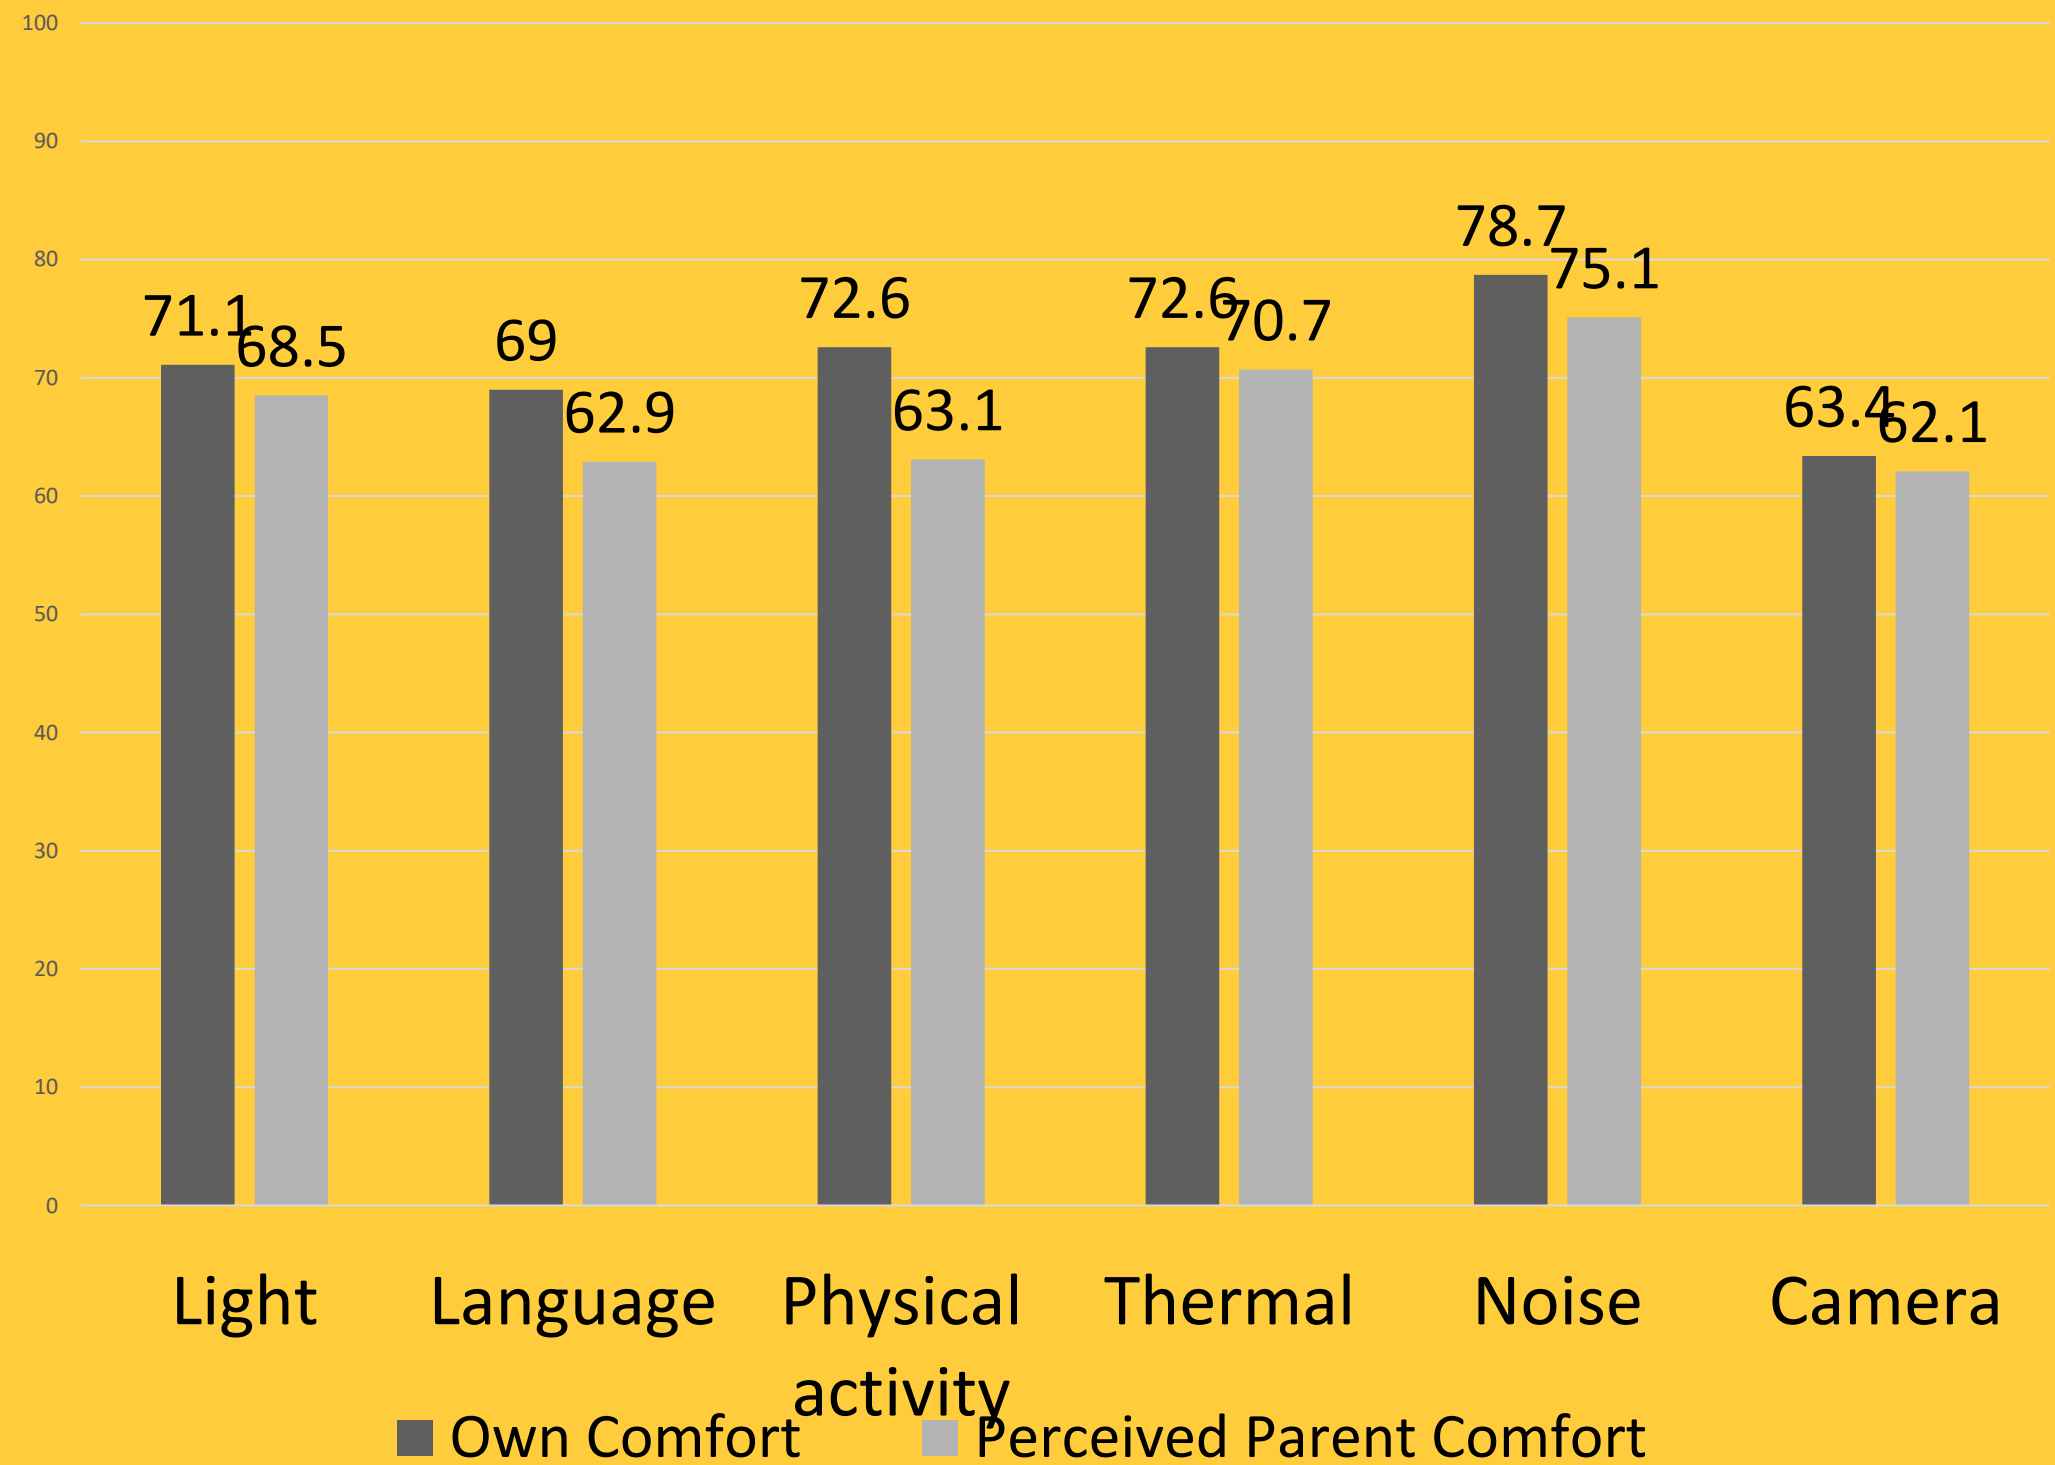

Survey Findings

Participants' mean ratings of the usefulness and effort needed for each sensor type.

What are ECEC professionals' perceptions of the use of sensors to measure aspects of quality within programs?

Survey Findings

Participants' mean ratings of their own comfort and perceived comfort of parents for each sensor type

Perceptions of specific sensors

Light sensors

- Could be beneficial, some unsure of utility
- Parents would be supportive or indifferent

Noise sensors

- Would be beneficial
- Some concerns related to privacy and poor reflection of teaching practices
- Parents supportive w/ feedback

Thermal sensors

- Could provide important feedback, understand children's behavior
- Some have lack of control
- Parents supportive

Interview Findings

Perceptions of specific sensors

Language sensors

- Could have positive impact
- Would require effort
- Concerns of privacy and data storage
- Parents perceptions varied

Physical activity sensors

- Would be beneficial
- Concerns related to distraction, privacy of data, additional effort (a little to a lot)
- Parents supportive w/ feedback

Interview Findings

What do ECEC professionals feel is needed to support the use of sensors within programs?

General privacy/security concerns

- Overall perceived minimal concern but communication key

General support needed

- Education of parents and ECEC professionals
- Differences between settings

Interview Findings

Take Home Points

Educator Perception

There is
interest

Communication
is key

Initial Findings from Deploying a Sensor in an Early Childhood Setting

Purpose

Use what we learned from lit review + ECEC professionals to conduct a trial sensor deployment

Explore the sound environment via:

- 1) Noise sensor measurements
- 2) Provider perception surveys
- 3) Child behavior sensors (language)

Soundscape Study Components

Noise

Precision measurement of existing, ambient noise

Survey

7 questions via Survey Monkey
(11 respondents)

Language

Language data
(1 center)

Reports

Feedback to care providers

3 early childhood centers

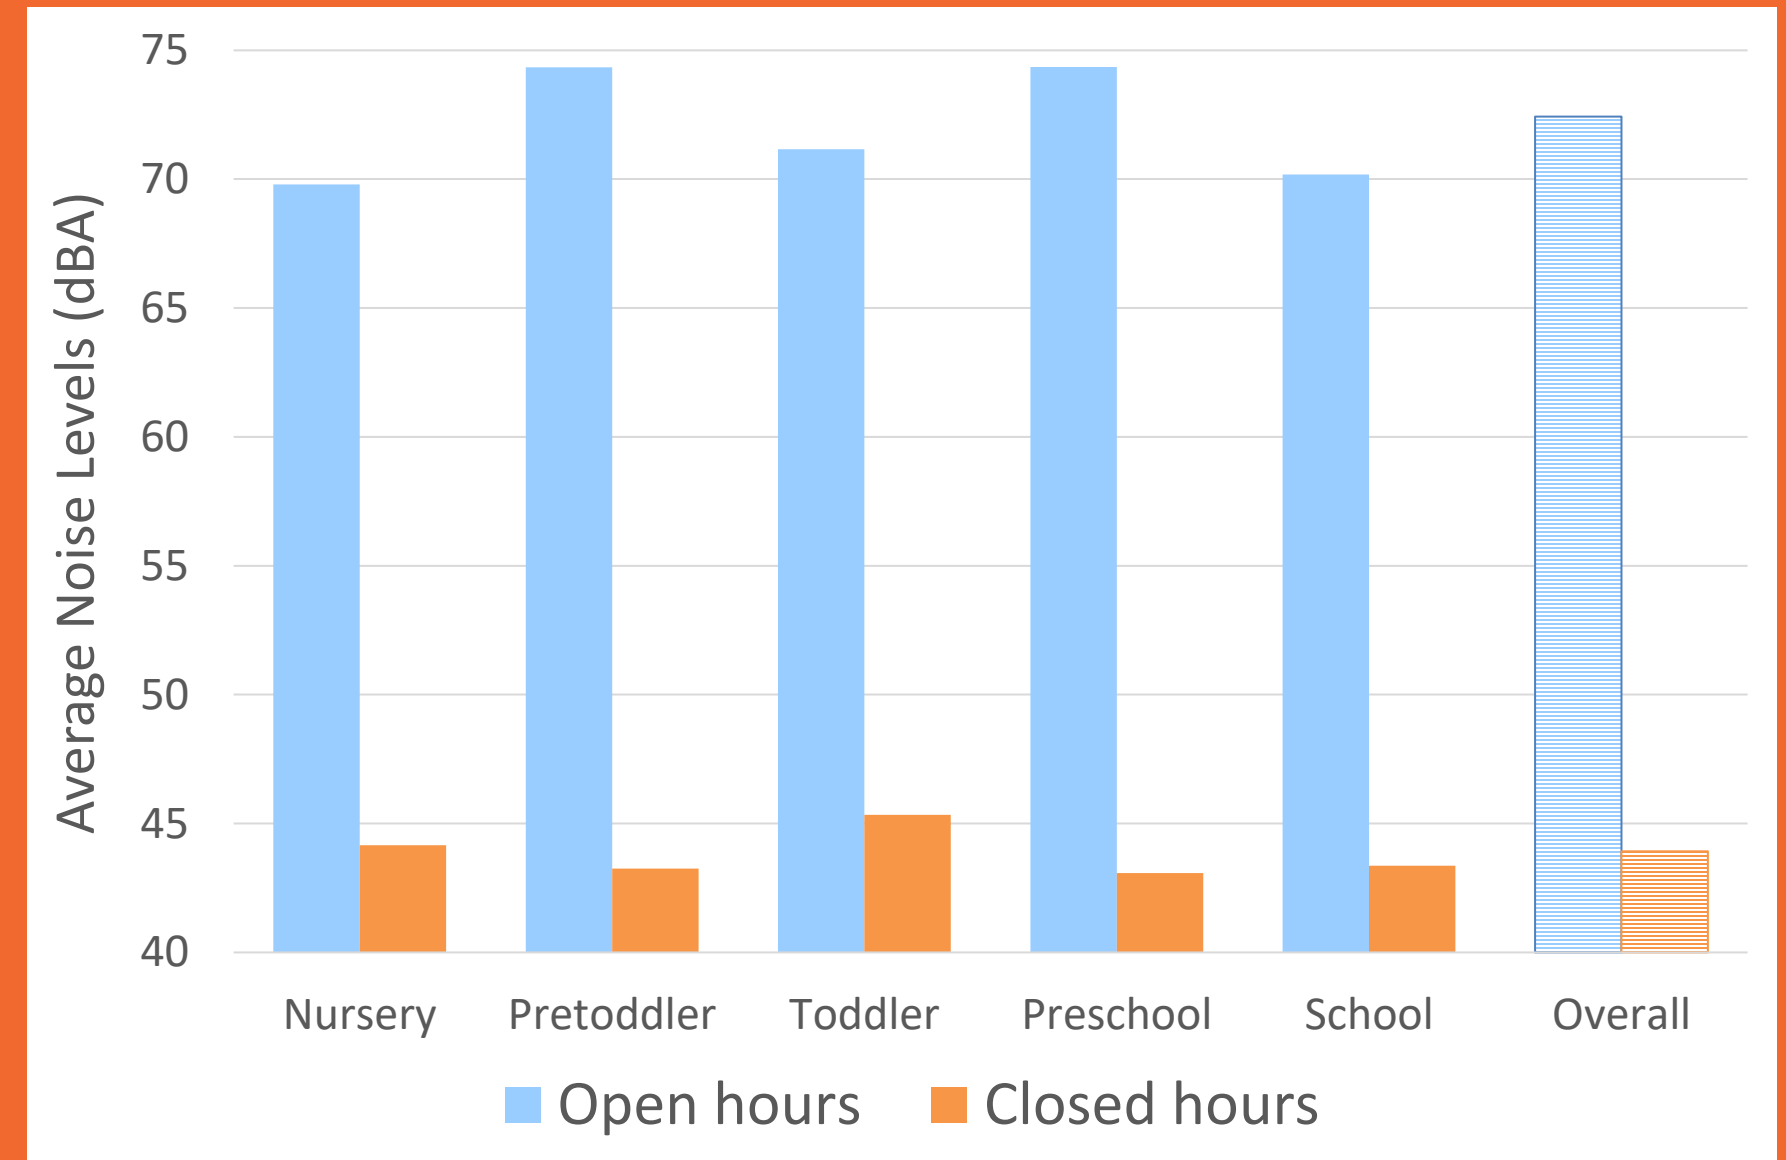

5 rooms per center

48 hours of sensor monitoring per room

Example Noise Findings

High average sound levels during
open hours

- Range of 62 to 74 dBA across 3 centers

Example average noise data collected at a single center

Example Noise Findings

Large fluctuations over time

- Some patterns emerge, such as noticeable reductions during rest time in some rooms

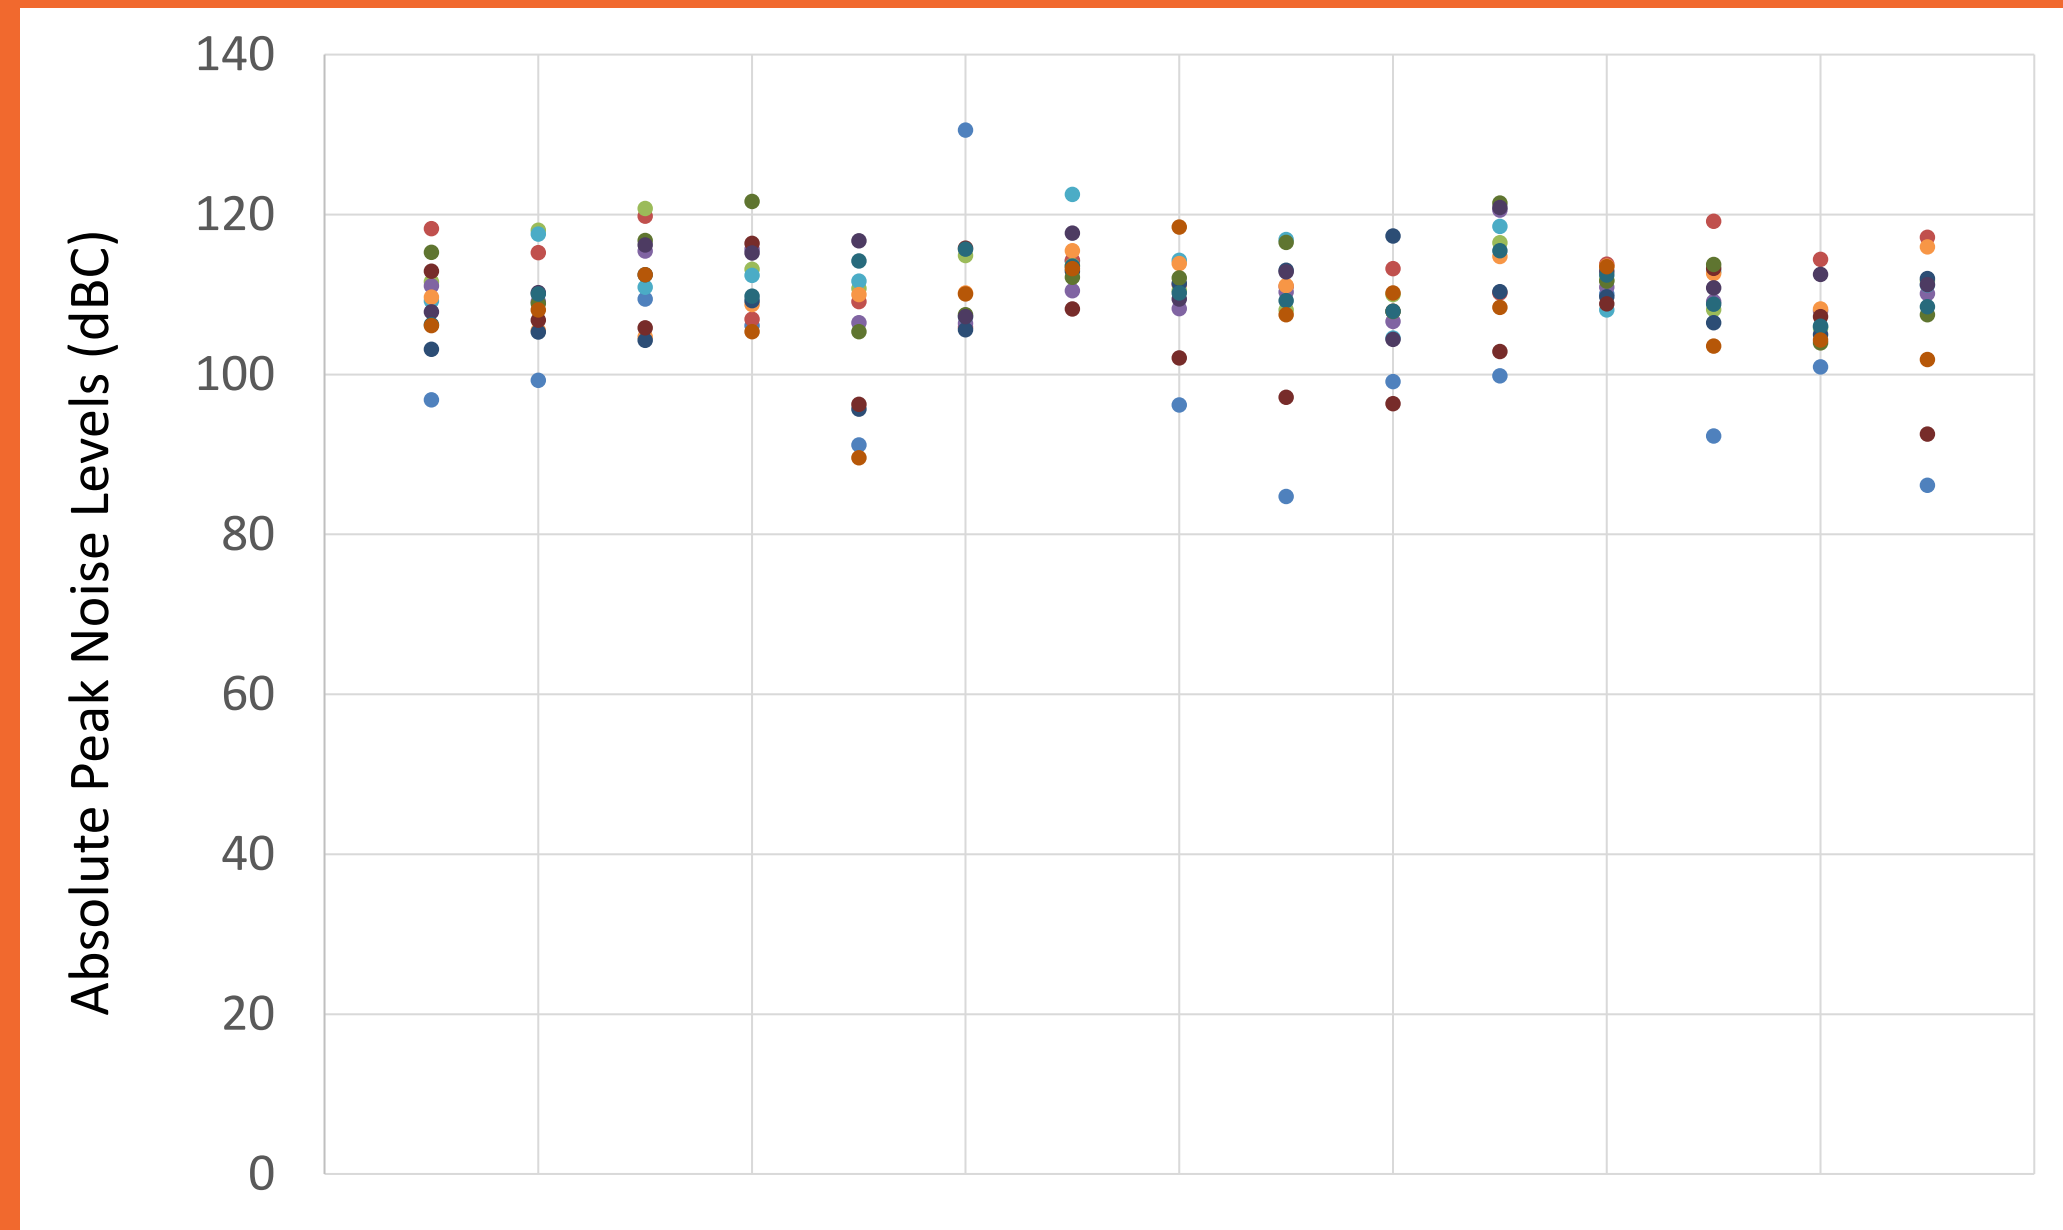

Example 1-minute average noise data collected over 48
hours
at a single center

Example Noise Findings

Some very loud peak events
observed

- up to 131 dBC

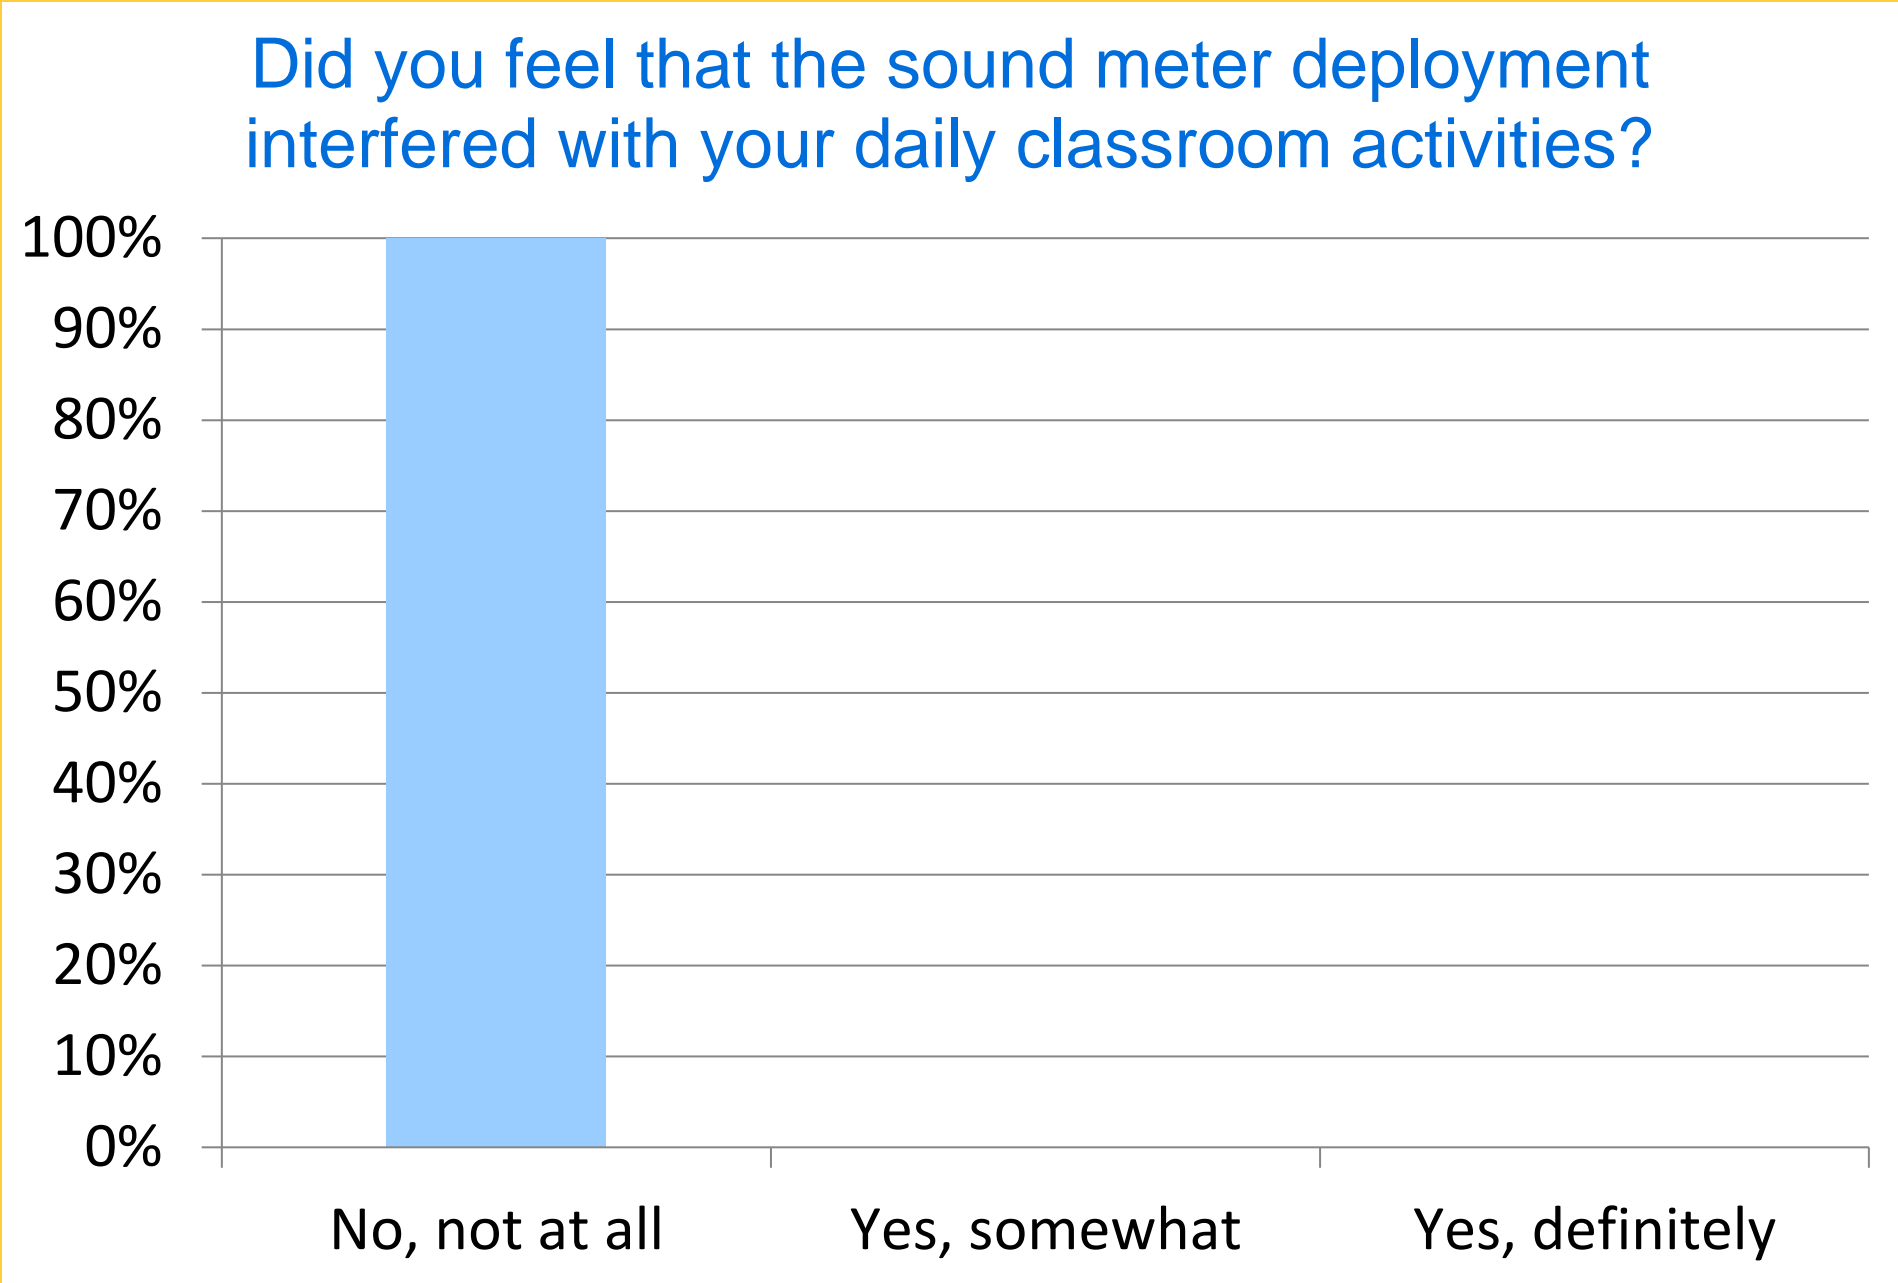

Example hourly peak noise data collected at all 3 centers

What are teacher's perceptions of the noise sensors?

Survey Findings

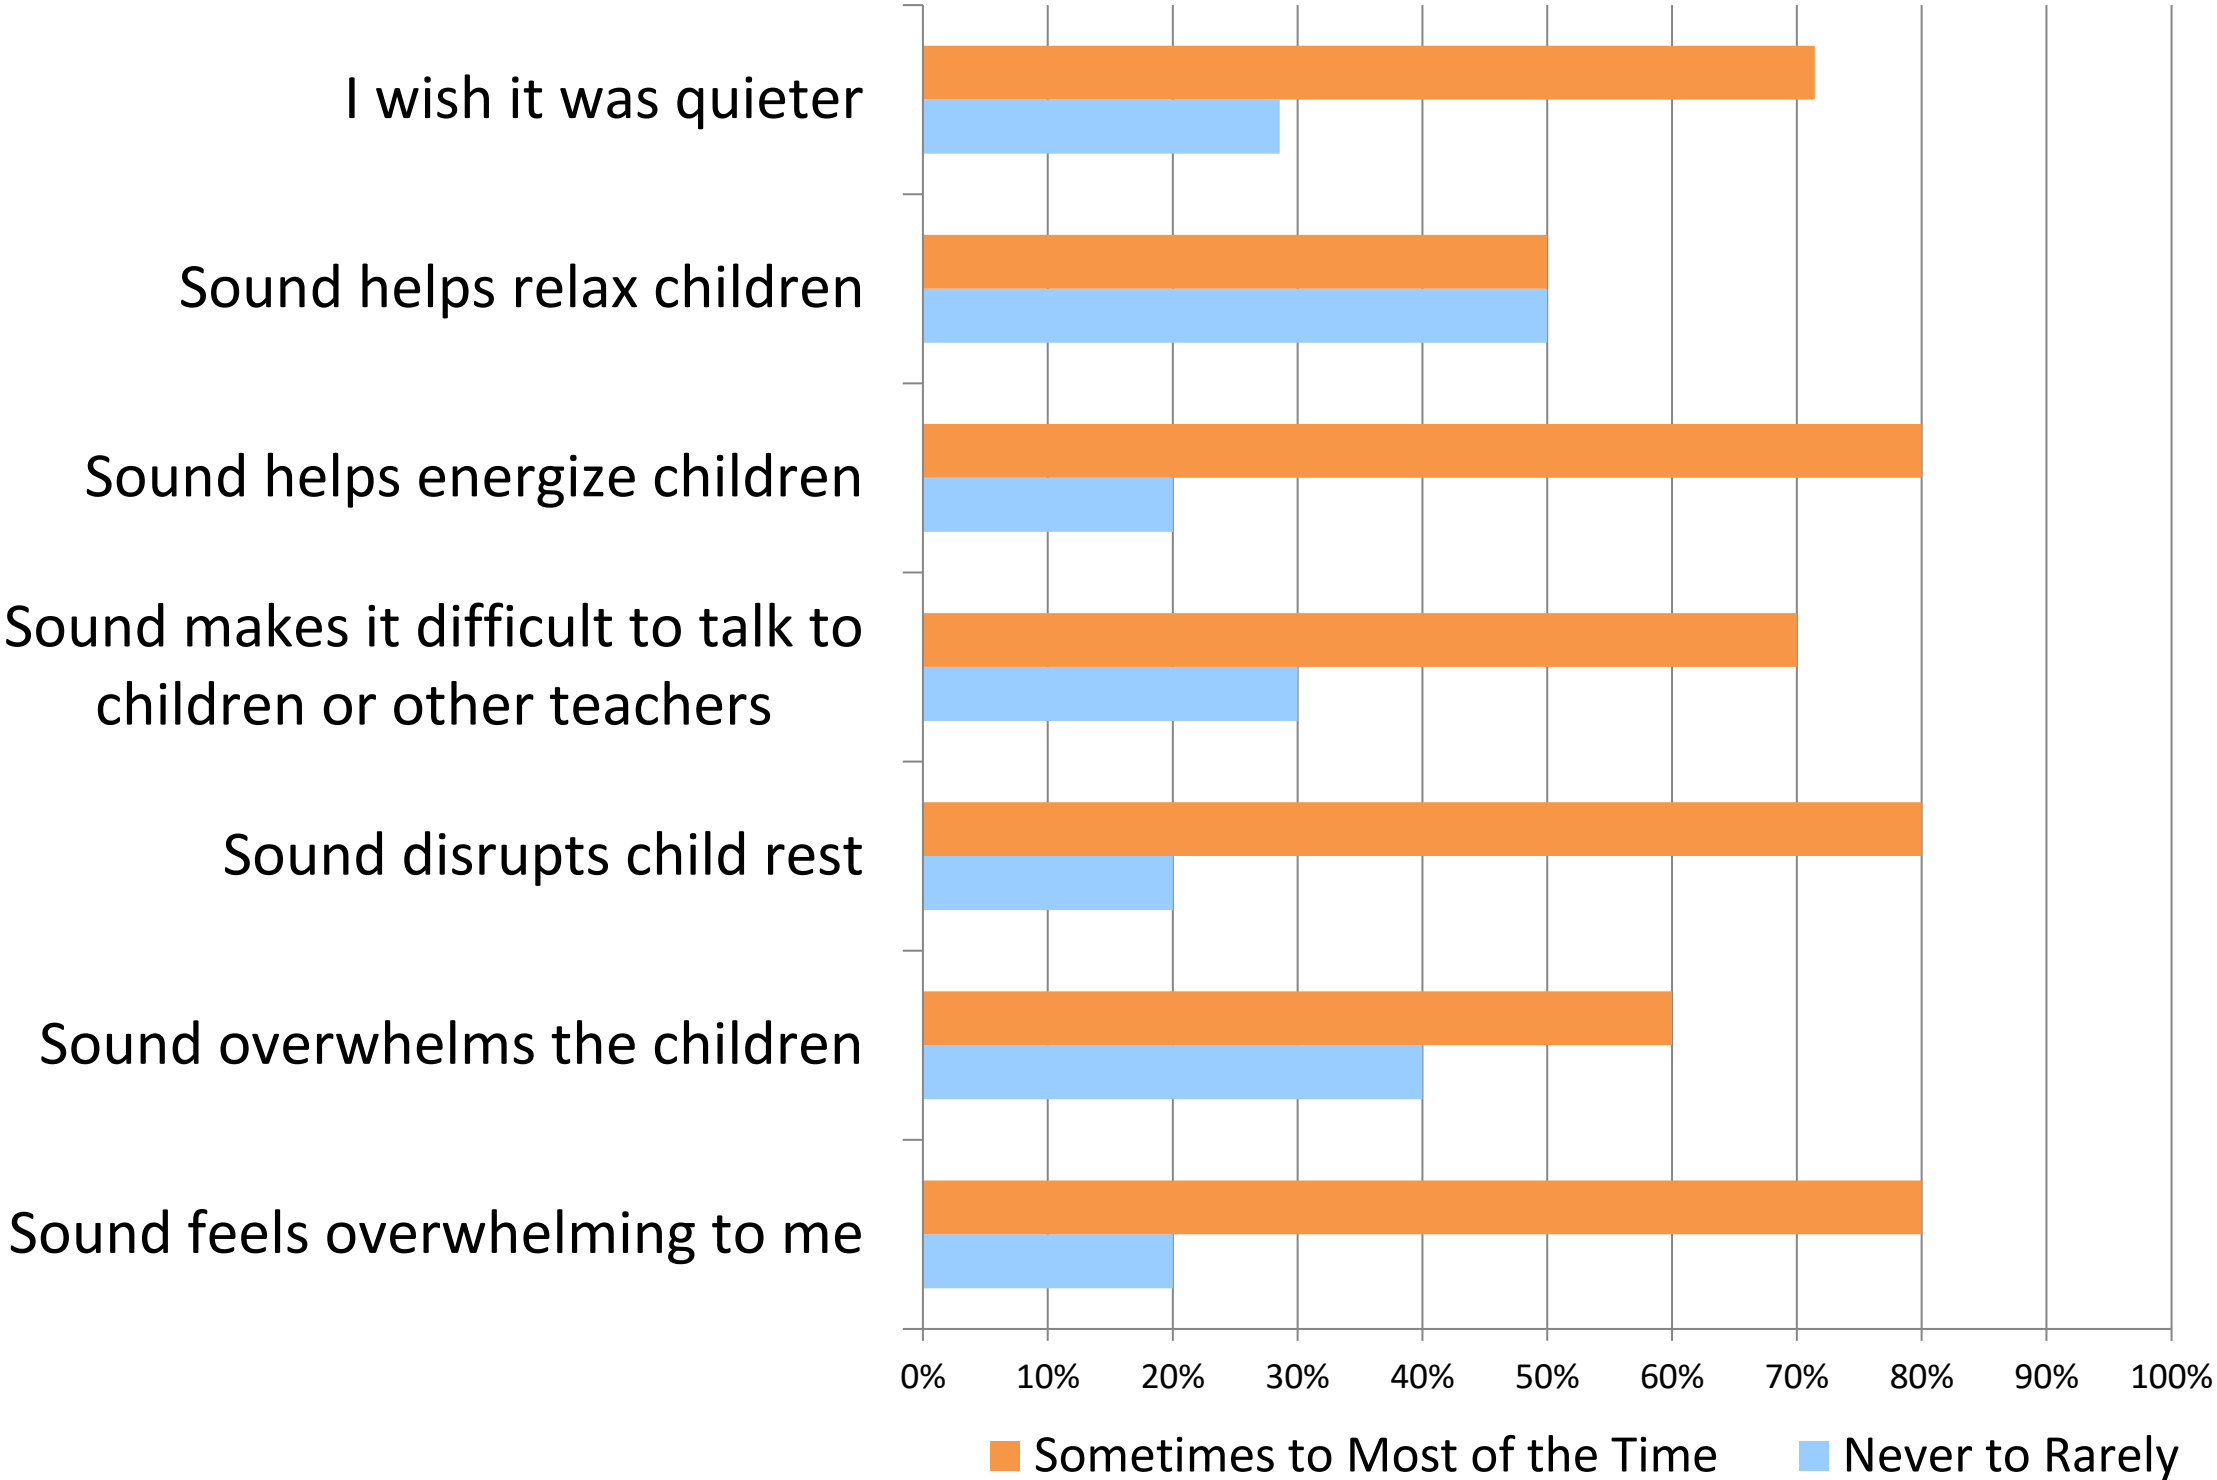

What are teacher's perceptions of the sound environment?

Survey Findings

How often do you experience the following in your main classroom?

Perceptions of sound environment

Negative Aspects

- “the sound can get **overwhelming** at times”
- “When it gets loud, **my kids talk louder** to hear each other”
- “music used to distract or drown out noise at **loud volumes often**”

Positive Aspects

- “music helps them **refocus & come together**”
- suggest “using a sound machine or more natural sounds to help **soothe, cue or support transitions and emotions**”

Survey Findings

Survey Findings

Perceptions of sound environment

“I'm excited to look more into ways to help support teachers, students and kids to use sound the most effectively!”

Take Home Points

Sensor Deployment

Providers
were excited
about
sensors

Sensors
provide
useful
insights

Additional
work
ongoing

Conclusions

Sensors may provide new insights on childcare quality

Sensors can be easily deployed and can generate relevant data

Parents and teachers both open to exploring more fully
